Programovanie v oeračných systémoch

03 - Filesystem IO

Jozef Šiška

Department of Applied Informatics
Comenius University in Bratislava

2016/2017

- VFS (virtual filesystem)
- mounted "real" filesystems (`mount(2)`)
- files
    - name, data, metadata
    - inode
    - open (creat), close, read, write, stat, ...
- directories ("folders")
    - list of entries (files, directories)
    - open, close, readdir, getdents, ...

Filesystem related calls

fd = open(path, flags)	Open/create a file
close(fd)	Close a file
count = read(fd, &buf, count)	Read from file
count = write(fd, &buf, count)	Write to a file
pos = lseek(fd, offset, whence)	Change position
stat(path, &buf), fstat(fd, &buf)	Get file (status) information
access(name, mode)	Check accessibility / existence
chmod(n, mode), chown(n, u, g)	Change permissions, owner
utime(name, times)	Change file access / modification times
umask(mode)	Change file creation mode mask
rename(old, new)	Rename file
mkdir(name, mode), rmdir(name)	Create / remove empty directory
link(n1, n2), unlink(name)	Create link, remove dir entry
mount(special, name, flags)	Mount fs
umount(special)	Unmount fs
sync(), syncfs(), fsync(), fdatasync()	Synchronize file(system) to disk
chdir(dirname), chroot(dirname)	Change current / root directory

dup(fd), dup2(fd,newfd), dup3(..., flags)	Duplicate fd
fcntl(fd, cmd, args. . .)	File "operations"
ioctl(fd, request, args...)	"Special" operations on fd

Maybe not a file:

- Regular files, directories
- Block and character devices
- Pipes
- Sockets

pipe, pipe2	Creates a pipe
mknod	Create "special" (device) files

dup(fd), dup2(fd,newfd), dup3(..., flags)	Duplicate fd
fcntl(fd, cmd, args. . .)	File "operations"
ioctl(fd, request, args...)	"Special" operations on fd

Maybe not a file:

- Regular files, directories
- Block and character devices
- Pipes
- Sockets

pipe, pipe2	Creates a pipe
mknod	Create "special" (device) files

- open(. . . , O_NONBLOCK)
- fcntl on already open fds

  ```
  int flags = fcntl(fd, F_GETFL, 0); // check for −1
  fcntl(fd, F_SETFL, flags | O_NONBLOCK); // check for −1
  ```

- read/write: return EAGAIN, EWOULDBLOCK
- select, poll, epoll: Wait for events on file descriptors
- ioctl(fd, FIONREAD, &bytes_available)

Filesystem io always returns the full file size as available, and will block (if data needs to be read from disk etc.).

Get output of a program

```c
int pipefd[2];
pid_t pid;

pipe(pipefd);

pid = fork();
if (pid == 0) { // child
        dup2(pipefd[1], 1);
        execvp(argv[1], argv+1);
} else { // parent
        char buffer[1024];
        ssize_t br = read(pipefd[0], buffer, sizeof(buffer));
        printf("Output:_%.*s\n", (int)br, buffer);
        int wstatus;
        if (waitpid(pid, &wstatus, 0) == -1) {
                perror("waitpid");
                exit(EXIT_FAILURE);
        }
        if (WIFEXITED(wstatus)) {
                printf("Exited:_%d\n", WEXITSTATUS(wstatus));
        }
}
return 0;
```
